NSK Bearing Doctor
Diagnosis of Bearing Problems

Objective: Smooth & reliable operation.
On the occasion of the “New Bearing Doctor” pamphlet being published, we would like to express our sincere thanks for your continuous patronage of NSK products.

This pamphlet contains explanations about correct bearing handling, mounting, lubrication, and maintenance to prevent premature failure along with color photos of bearing failures. Please be sure to consult the NSK Rolling Bearing Catalog (CAT. No. E1101a) for more details regarding handling, maintenance, etc.

Bearings become unserviceable when they suffer premature failure which is due to a lack of attention to proper handling and/or maintenance. Premature failure is completely different from flaking (life) due to rolling fatigue. This pamphlet is useful in determining causes of and countermeasures against premature failure. It’s our pleasure to offer you this pamphlet.

Appendix - Bearing Diagnostic Chart 34
1. Introduction

When a rolling bearing is damaged during machine operation, the entire machine or equipment may seize or malfunction. Since bearings that fail prematurely or unexpectedly cause trouble, it is important to be able to identify and predict failure beforehand, if possible, so that preventative measures can be adopted.

Generally, bearing inspection or housing inspection can identify the cause of the problem. Often the cause is attributable to poor lubrication, improper handling, selecting the wrong bearing, or not enough study of the shaft and housing. Usually the cause can be determined by considering operation of the bearing before the failure, investigating the lubrication conditions and the mounting condition, and carefully observing the damaged bearing itself.

2. Bearing Handling

2.1 Precautions for Handling

Since rolling bearings are high precision machine parts, they must be handled carefully. Even if high quality bearings are used, their expected life and performance cannot be attained if they are used improperly. The main precautions to be observed are as follows:

(1) Keep the Bearings and Surrounding Area Clean
Dust and dirt, even if invisible to the naked eye, have harmful effects on bearings. It is necessary to prevent the entry of dust and dirt by keeping the bearings and their environment as clean as possible.

(2) Careful Handling
Heavy shocks during handling may scratch or cause other damage to the bearing possibly resulting in bearing failure. Strong impacts may cause brinelling, breaking, or cracking.

(3) Use Proper Tools
Always use the proper tool when handling bearings and avoid general purpose tools.

(4) Prevent Corrosion
Since perspiration on the hands and various other contaminants may cause corrosion, keep your hands clean when handling bearings. Wear gloves if possible.

2.2 Mounting

It is advisable to study the bearing mounting thoroughly since the quality of the bearing mounting influences the bearing’s running accuracy, life, and performance. It is recommended that the mounting method include the following steps:

(1) Clean the bearing and surrounding parts;

(2) Check the dimensions and finish conditions of related parts;

(3) Follow mounting procedure;

(4) Check if the bearing is mounted correctly;

(5) Supply with correct kind and quantity of lubricant.

Since most bearings rotate with the shaft, the bearing mounting method is generally an interference (tight) fit for the inner ring and shaft while giving a clearance (loose) fit for the outer ring and housing.

2.3 Check the Operation

After mounting the bearing, it is important to carry out an operating test to confirm that the bearing is mounted properly. Table 2.1 indicates operating test methods. If irregularities are detected, immediately suspend the test and consult Table 2.2 which lists appropriate countermeasures to specific bearing problems.
### Table 2.1 Methods to check operation

<table>

**NSK**
3. Bearing Maintenance

It is necessary to periodically inspect and maintain the bearing and its operating conditions in order to maximize the bearing life. In general, the following method is adopted:

(1) Inspection under operating conditions
To determine the bearing replacement periods and replenishment intervals for lubricant, investigate the lubricant properties and consider factors such as operating temperature, vibration, and bearing noise. (Refer to Section 4 for more details.)

(2) Inspection of the bearing
Be sure to investigate the bearing thoroughly during times of periodic machine inspection and part replacement. Check the raceway condition. Determine if damage exists. Confirm if the bearing can be reused or should be replaced. (Refer to Section 5 for more details.)

4. Bearing Performance Factors

Key bearing performance factors during operation are bearing noise, vibration, temperature, and lubricant state. Please refer to Table 2.2 if any operation irregularities are detected.

4.1 Bearing Noise

During operation, sound detection instruments (stethoscope, NSK Bearing Monitor, etc.) can be used to investigate the volume and characteristics of the bearing rotation noise. It is possible to distinguish bearing damage such as small flaking by means of its unusual yet characteristic noise.

4.2 Bearing Vibration

Bearing irregularities can be analyzed by measuring the vibrations of an operating machine. A frequency spectrum analyzer is used to measure the magnitude of vibration and the distribution of the frequencies. Test results enable the determination of the likely cause of the bearing irregularity. The measured data varies depending on the operating conditions of the bearing and the location of the vibration pick-up. Therefore, the method requires the determination of evaluation standards for each measured machine.

It is useful to be able to detect irregularities from the bearing vibration pattern during operation. Please refer to the NSK pamphlet Pr. No. 410 (Bearing Monitor) for more information about such a device.

4.3 Bearing Temperature

Generally, the bearing temperature can be estimated from the temperature of the housing outside surface, but a preferable way is to obtain direct measurements from the bearing outer ring by a probe going through an oil hole.

Usually, the bearing temperature gradually increases after the start of operation until reaching a steady state condition about 1 or 2 hours later. The bearing steady state temperature depends on load, rotational speed and heat transfer properties of the machine. Insufficient lubrication or improper mounting might cause the bearing temperature to rise rapidly. In such a case, suspend the machine operation and adopt an appropriate countermeasure.

4.4 Effects of Lubrication

The two main purposes of lubrication are to minimize friction and reduce wear inside bearings that might otherwise fail prematurely. Lubrication provides the following advantages:

(1) Reduction of Friction and Wear
Direct metallic contact between the bearing rings, rolling elements and cage, which are the basic components of a bearing, is prevented by an oil film which reduces the friction and wear in the contact areas.

(2) Extension of Fatigue Life
The rolling fatigue life of bearings depends greatly upon the viscosity and film thickness between the rolling contact surfaces. A heavy film thickness prolongs the fatigue life, but it is shortened if the viscosity of the oil is too low so that the film thickness is insufficient.

(3) Dissipation of Frictional Heat and Cooling
Circulation lubrication may be used to carry away either frictional heat or heat transferred from the outside to prevent the bearing from overheating and the oil from deteriorating.

(4) Sealing and Rust Prevention
Adequate lubrication also helps to prevent foreign material from entering the bearings and guards against corrosion or rusting.

4.5 Selection of Lubrication

Bearing lubrication methods are divided into two main categories: grease lubrication and oil lubrication. A lubrication method is adopted that matches the application conditions and application purpose in order to attain best performance from the bearing. Table 4.1 shows a comparison between grease and oil lubrication.

Table 4.1 Comparison between grease and oil lubrication

<td>Often leaks if proper countermeasures are not taken. Not suitable if external contamination must be avoided.</td>
</tr>
</tbody>
</table>
(1) Grease lubrication
Grease is a lubricant that is made from base oil, thickener, and additives. When selecting a grease, it is necessary to select a grease that is suitable to the bearing application conditions. There are large differences in performance even between different brands of the same type of grease. Therefore special attention must be given to grease selection. Table 4.2 gives examples of applications and grease consistency.

(2) Oil lubrication
There are several different oil lubrication methods: Oil bath, Drip feed, Splash, Circulating, Jet, Oil mist, and Oil air. Oil lubrication methods are more suitable for higher speed and higher temperature applications than are grease lubrication methods. Oil lubrication is especially effective in the case where it is necessary to dissipate heat to the exterior.

Be sure to select a lubricating oil that has suitable viscosity at the bearing operating temperature. Generally, an oil with a low viscosity is used for high speed application while an oil with high viscosity is used for applications with heavy loads. For normal application conditions, Table 4.3 lists the suitable viscosity range for the operating temperature.

For reference when making a selection, Fig. 4.1 shows the relationship between temperature and viscosity for the lubricating oil. Table 4.4 gives examples of how to select the lubrication oil for different bearing application conditions.

<td>-</td>
<td></td>
</tr>
</tbody>
</table>

Notes:
1. As for the limiting speed, use the value listed under oil lubrication in the Bearing Dimension Tables of "NSK Rolling Bearings" (No. E140).
2. Refer to refrigerator oil (JIS K2211), Bearing oil (JIS K2239), Turbine oil (JIS K2213), Gear oil (JIS K2219).
3. Temperature ranges are shown in the left column in the table above. For operating temperatures that are on the high temperature side, a high viscosity lubrication oil is recommended.
4.6 Replenishment and Replacement of Lubricant

(1) Grease replenishment intervals
As time passes, grease deteriorates and the lubricating ability is degraded. Be sure to replenish the grease at the correct interval. The grease replenishment interval depends on factors like the bearing type, dimensions, and rotation speed. Fig. 4.2 shows approximate grease replenishment intervals as a function of operating time and rotational speed. As a general rule, the grease replenishment interval should be halved for each 15°C bearing temperature rise above 70°C.

(2) Lubrication oil replacement interval
The oil replacement intervals depend on the operating conditions and the oil quantity. In general, for an operating temperature under 50°C, and in clean environments, the replacement interval is 1 year. If the oil temperature is above 100°C, then the oil should be changed at least once every three months.

5. Bearing Inspection

When inspecting a bearing during periodic inspection of equipment, operating inspections, or replacement of adjacent parts, determine the condition of the bearing and if its continued service is advisable.

A record should be kept of the inspection and external appearance of dismounted bearings. After taking a grease sample and measuring the quantity of residual grease, the bearing should be cleaned. Also, determine whether abnormalities and damage exist in the cage, fitting surfaces, rolling element surfaces, and raceway surfaces. Refer to Section 6 regarding the observation of running traces on the raceway surface.

When evaluating whether a bearing can be reused or not, the following points need to be considered: degree of bearing damage, machine performance, critical nature of the application, operating conditions, inspection interval. If the inspection reveals bearing damage or abnormalities, then try to confirm the cause and determine a countermeasure by referring to Section 7 and then carry out the countermeasure.

If your inspection discovers any of the following kinds of damage, which would prevent the bearing from being reused, then the bearing must be replaced with a new one.

(1) Cracks or chipping in the cage, rolling elements, or raceway ring.
(2) Flaking in the rolling elements or raceway ring.
(3) Notable scoring on the rolling elements, rib face (collar), or raceway surface.
(4) Notable wear on the cage or loose rivets.
(5) Flaws or rust on the rolling elements or raceway surface.
(6) Notable dents on the rolling elements or raceway surface.
(7) Notable creep of the outer ring outside surface or inner ring bore.
(8) Discoloration due to heating.
(9) Serious damage on shield or seal of grease packed bearings.
6. Running Traces and Applied Loads

As the bearing rotates, the raceways of the inner ring and outer ring make contact with the rolling elements. This results in a wear path on both the rolling elements and the raceways. Running traces are useful, since they indicate the loading conditions, and should be carefully observed when the bearing is disassembled.

If the running traces are clearly defined, it is possible to determine whether the bearing is carrying a radial load, axial load or moment load. Also, the roundness condition of the bearing can be determined. Check whether unexpected bearing loads or large mounting errors occurred. Also, determine the probable cause of the bearing damage.

Fig. 6.1 shows the running traces generated in deep groove bearings under various load conditions. Fig. 6.1 (a) shows the most common running trace generated when the inner ring rotates under a radial load only. Figs. 6.1 (e) through (h) show several different running traces that result in a shortened life due to their adverse effect on the bearings.

Similarly, Fig. 6.2 shows different roller bearing running traces: Fig. 6.2 (i) shows the outer ring running trace when a radial load is properly applied to a cylindrical roller bearing which has a load on a rotating inner ring. Fig. 6.2 (j) shows the running trace in the case of shaft bending or relative inclination between the inner and outer rings. This misalignment leads to the generation of slightly shaded (dull) bands in the width direction. Traces are diagonal at the beginning and end of the loading zone. For double-row tapered roller bearings where a single load is applied to the rotating inner ring, Fig. 6.2 (k) shows the running trace on the outer ring under radial load while Fig. 6.2 (l) shows the running trace on the outer ring under axial load. When misalignment exists between the inner and the outer rings, then the application of a radial load causes running traces to appear on the outer ring as shown in Fig. 6.2 (m).

![Fig. 6.1 Typical running traces of deep groove ball bearings](image)
In general, if rolling bearings are used correctly, they will survive to their predicted fatigue life. Bearings, however, often fail prematurely due to avoidable mistakes. In contrast to fatigue life, this premature failure is caused by improper mounting, mishandling, poor lubrication, entry of foreign matter or abnormal heat generation.

For example, one cause of premature failure is rib scoring which is due to insufficient lubrication, use of improper lubricant, faulty lubrication system, entry of foreign matter, bearing mounting error, excessive deflection of the shaft or some combination of these. If all conditions are known for the times both before and after the failure, including the application, the operating conditions, and environment, then a countermeasure can be determined by studying the nature of the failure and its probable causes. A successful countermeasure will reduce similar failures or prevent them from happening again.

Sections 7.1 through 7.18 give examples of bearing damage and countermeasures. Please consult these sections when trying to determine the cause of bearing damage. By the way, the bearing diagnostic chart in the Appendix may be useful as a quick reference guide.

Part: Convex rollers of Photo 7-3-5
Symptom: Scoring on the roller end face
Cause: Debris, which is caught in surface, and excessive axial loading

Photo 7-3-7
Part: Cage of a deep groove ball bearing
Symptom: Scoring on the pressed-steel cage pockets
Cause: Entry of debris
### 7.4 Smearing

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| Smearing is surface damage which occurs from a collection of small seizures between bearing components caused by oil film rupture and/or sliding. Surface roughening occurs along with melting. | • High speed and light load  
• Sudden acceleration/deceleration  
• Improper lubricant  
• Entry of water | • Improve the preload  
• Improve the bearing clearance  
• Use a lubricant with good oil film formation ability  
• Improve the lubrication method  
• Improve the sealing mechanism |

---

**Photo 7-4-1**
- **Part:** Inner ring of a cylindrical roller bearing
- **Symptom:** Smearing occurs circumferentially on raceway surface
- **Cause:** Roller slipping due to excessive grease filling

**Photo 7-4-2**
- **Part:** Outer ring of Photo 7-4-1
- **Symptom:** Smearing occurs circumferentially on raceway surface
- **Cause:** Roller slipping due to excessive grease filling

**Photo 7-4-3**
- **Part:** Inner ring of a spherical roller bearing
- **Symptom:** Smearing occurs circumferentially on raceway surface
- **Cause:** Poor lubrication

**Photo 7-4-4**
- **Part:** Outer ring of Photo 7-4-3
- **Symptom:** Smearing occurs circumferentially on raceway surface
- **Cause:** Poor lubrication
Part: Inner ring of a spherical roller bearing  
Symptom: Partial smearing occurs circumferentially on raceway surface
Cause: Poor lubrication

Part: Outer ring of Photo 7-4-5  
Symptom: Partial smearing occurs circumferentially on raceway surface
Cause: Poor lubrication

Part: Convex rollers of Photo 7-4-5  
Symptom: Smearing occurs at the center of the rolling surface
Cause: Poor lubrication
### 7.5 Fracture

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| Fracture refers to small pieces which were broken off due to excessive load or shock load acting locally on a part of the roller corner or rib of a raceway ring. | • Impact during mounting  
• Excessive load  
• Poor handling such as dropping | • Improve the mounting method (Shrink fit, use of proper tools  
• Reconsider the loading conditions  
• Provide enough back-up and support for the bearing rib |

**Photo 7-5-1**  
**Part:** Inner ring of a double-row cylindrical roller bearing  
**Symptom:** Chipping occurs at the center rib  
**Cause:** Excessive load during mounting

**Photo 7-5-2**  
**Part:** Inner ring of a tapered roller bearing  
**Symptom:** Fracture occurs at the cone back face rib  
**Cause:** Large shock during mounting

**Photo 7-5-3**  
**Part:** Inner ring of a spherical thrust roller bearing  
**Symptom:** Fracture occurs at the large rib  
**Cause:** Repeated load

**Photo 7-5-4**  
**Part:** Outer ring of a solid type needle roller bearing  
**Symptom:** Fracture occurs at the outer ring rib  
**Cause:** Roller inclination due to excessive loading  
(Needle rollers are long compared to their diameter. Under excessive or uneven loading, rollers become inclined and push against the ribs.)
### 7.6 Cracks

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| Cracks in the raceway ring and rolling elements. Continued use under this condition leads to larger cracks or fractures. | • Excessive interference  
• Excessive load, shock load  
• Progression of flaking  
• Heat generation and fretting caused by contact between mounting parts and raceway ring  
• Heat generation due to creep  
• Poor taper angle of tapered shaft  
• Poor cylindricality of shaft  
• Interference with bearing chamfer due to a large shaft corner radius | • Correct the interference  
• Check the load conditions  
• Improve the mounting method  
• Use an appropriate shaft shape |

**Photo 7-6-1**  
Part: Outer ring of a double-row cylindrical roller bearing  
Symptom: Thermal cracks occur on the outer ring side face  
Cause: Abnormal heat generation due to contact sliding between mating part and face of outer ring

**Photo 7-6-2**  
Part: Roller of a tapered roller thrust bearing  
Symptom: Thermal cracks occur at large end face of roller  
Cause: Heat generation due to sliding with the inner ring rib under poor lubrication

**Photo 7-6-3**  
Part: Outer ring of a double-row cylindrical roller bearing  
Symptom: Cracks propagated outward in the axial and circumferential directions from the flaking origin on the raceway surface  
Cause: Flaking from a flaw due to shock
Part: Outer ring of a double-row cylindrical roller bearing used for outer ring rolling (Outer ring rotation)
Symptom: Cracks occur on outside surface
Cause: Flat wear and heat generation due to non-rotation of the outer ring

Part: Raceway surface of outer ring in Photo 7-6-4
Symptom: Outside surface crack developing on the raceway

Part: Inner ring of a spherical roller bearing
Symptom: Axial cracks occur on raceway surface
Cause: Large fitting stress due to temperature difference between shaft and inner ring

Part: Cross section of a fractured inner ring in Photo 7-6-6
Symptom: Origin is directly beneath the raceway surface

Part: Roller of a spherical roller bearing
Symptom: Axial cracks occur on rolling surface
### 7.7 Cage Damage

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cage damage includes cage deformation, fracture, and wear.</td>
<td>• Poor mounting (Bearing misalignment)</td>
<td>• Check the mounting method</td>
</tr>
<tr>
<td>Fracture of cage pillar.</td>
<td>• Poor handling</td>
<td>• Check the temperature, rotation, and load conditions</td>
</tr>
<tr>
<td>Deformation of side face.</td>
<td>• Large moment load</td>
<td>• Reduce the vibration</td>
</tr>
<tr>
<td>Wear of pocket surface.</td>
<td>• Shock and large vibration</td>
<td>• Select a cage type</td>
</tr>
<tr>
<td>Wear of guide surface.</td>
<td>• Excessive rotation speed, sudden acceleration and deceleration</td>
<td>• Select a lubrication method and lubricant</td>
</tr>
<tr>
<td></td>
<td>• Poor lubrication</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Temperature rise</td>
<td></td>
</tr>
</tbody>
</table>

**Possible Cause**

- Poor mounting (Bearing misalignment)
- Poor handling
- Large moment load
- Shock and large vibration
- Excessive rotation speed, sudden acceleration and deceleration
- Poor lubrication
- Temperature rise

**Countermeasure**

- Check the mounting method
- Check the temperature, rotation, and load conditions
- Reduce the vibration
- Select a cage type
- Select a lubrication method and lubricant

---

**Photo 7-7-1**

**Part:** Cage of a deep groove ball bearing  
**Symptom:** Fracture of pressed-steel cage-pocket

**Photo 7-7-2**

**Part:** Cage of an angular contact ball bearing  
**Symptom:** Pocket pillar fractures from a cast iron machined cage
**Cause:** Abnormal load action on cage due to misaligned mounting between inner and outer rings

**Photo 7-7-3**

**Part:** Cage of an angular contact ball bearing  
**Symptom:** Fracture of machined high-tension brass cage

**Photo 7-7-4**

**Part:** Cage of a tapered roller bearing  
**Symptom:** Pillar fractures of pressed-steel cage
Part: Cage of an angular contact ball bearing  
Symptom: Pressed-steel cage deformation  
Cause: Shock load due to poor handling

Part: Cage of a cylindrical roller bearing  
Symptom: Deformation of the side face of a machined high-tension brass cage  
Cause: Large shock during mounting

Part: Cage of a cylindrical roller bearing  
Symptom: Deformation and wear of a machined high-tension brass cage

Part: Cage of an angular contact ball bearing  
Symptom: Stepped wear on the outside surface and pocket surface of a machined high-tension brass cage
### 7.8 Denting

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| When debris such a small metallic particles are caught in the rolling contact zone, denting occurs on the raceway surface or rolling element surface. Denting can occur at the rolling element pitch interval if there is a shock during the mounting (Brinell dents). | • Debris such as metallic particles are caught in the surface  
• Excessive load  
• Shock during transport or mounting | • Wash the housing  
• Improve the sealing mechanism  
• Filter the lubrication oil  
• Improve the mounting and handling methods |

#### Possible Cause

- Debris such as metallic particles are caught in the surface
- Excessive load
- Shock during transport or mounting

#### Countermeasure

- Wash the housing
- Improve the sealing mechanism
- Filter the lubrication oil
- Improve the mounting and handling methods

---

**Photo 7-8-1**

**Part:** Inner ring of a double-row tapered roller bearing  
**Symptom:** Frosted raceway surface  
**Cause:** Debris caught in the surface

**Photo 7-8-2**

**Part:** Outer ring of a double-row tapered roller bearing  
**Symptom:** Indentations on raceway surface  
**Cause:** Debris caught in the surface

**Photo 7-8-3**

**Part:** Inner ring of a tapered roller bearing  
**Symptom:** Small and large indentations occur over entire raceway surface  
**Cause:** Debris caught in the surface

**Photo 7-8-4**

**Part:** Tapered rollers of Photo 7-8-3  
**Symptom:** Small and large indentations occur over the rolling surface  
**Cause:** Debris caught in the surface
### 7.9 Pitting

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| The pitted surface has a dull luster which appears on the rolling element surface or raceway surface. | - Debris becomes caught in the lubricant  
- Exposure to moisture in the atmosphere  
- Poor lubrication | - Improve the sealing mechanism  
- Filter the lubrication oil thoroughly  
- Use a proper lubricant |

#### Photo 7-9-1
**Part:** Outer ring of a slewing bearing  
**Symptom:** Pitting occurs on the raceway surface  
**Cause:** Rust at bottoms of indentations

#### Photo 7-9-2
**Part:** Ball of Photo 7-9-1  
**Symptom:** Pitting occurs on the rolling element surface
## 7.10 Wear

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| Wear is surface deterioration due to sliding friction at the surface of the raceway, rolling elements, roller end faces, rib face, cage pockets, etc. | • Entry of debris  
• Progression from rust and electrical corrosion  
• Poor lubrication  
• Sliding due to irregular motion of rolling elements | • Improve the sealing mechanism  
• Clean the housing  
• Filter the lubrication oil thoroughly  
• Check the lubricant and lubrication method  
• Prevent misalignment |

### Photo 7-10-1
**Part:** Inner ring of a cylindrical roller bearing  
**Symptom:** Many pits occur due to electrical corrosion and wave-shaped wear on raceway surface  
**Cause:** Electrical corrosion

### Photo 7-10-2
**Part:** Outer ring of a spherical roller bearing  
**Symptom:** Wear having a wavy or concave-and-convex texture on loaded side of raceway surface  
**Cause:** Entry of debris under repeated vibration while stationary

### Photo 7-10-3
**Part:** Inner ring of a double-row tapered roller bearing  
**Symptom:** Fretting wear of raceway and stepped wear on the rib face  
**Cause:** Fretting progression due to excessive load while stationary

### Photo 7-10-4
**Part:** Tapered rollers of Photo 7-10-3  
**Symptom:** Stepped wear on the roller head end face  
**Cause:** Fretting progression due to excessive load while stationary
### 7.11 Fretting

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wear occurs due to repeated sliding between the two surfaces.</td>
<td>• Poor lubrication</td>
<td>• Use a proper lubricant</td>
</tr>
<tr>
<td>Fretting occurs at fitting surface and also at contact area between raceway ring and rolling elements.</td>
<td>• Vibration with a small amplitude</td>
<td>• Apply a preload</td>
</tr>
<tr>
<td>Fretting corrosion is another term used to describe the reddish brown or black worn particles.</td>
<td>• Insufficient interference</td>
<td>• Check the interference fit</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Apply a film of lubricant to the fitting surface</td>
</tr>
</tbody>
</table>

#### Photo 7-11-1
- **Part:** Inner ring of a deep groove ball bearing
- **Symptom:** Fretting occurs on the bore surface
- **Cause:** Vibration

#### Photo 7-11-2
- **Part:** Inner ring of an angular contact ball bearing
- **Symptom:** Notable fretting occurs over entire circumference of bore surface
- **Cause:** Insufficient interference fit

#### Photo 7-11-3
- **Part:** Outer ring of a double-row cylindrical roller bearing
- **Symptom:** Fretting occurs on the raceway surface at roller pitch intervals

### Damage Condition
- Wear occurs due to repeated sliding between the two surfaces.
- Fretting occurs at fitting surface and also at contact area between raceway ring and rolling elements.
- Fretting corrosion is another term used to describe the reddish brown or black worn particles.

### Possible Cause
- Poor lubrication
- Vibration with a small amplitude
- Insufficient interference

### Countermeasure
- Use a proper lubricant
- Apply a preload
- Check the interference fit
- Apply a film of lubricant to the fitting surface
### 7.12 False Brinelling

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| Among the different types of fretting, false brinelling is the occurrence of hollow spots that resemble brinell dents, and are due to wear caused by vibration and swaying at the contact points between the rolling elements and raceway. | • Oscillation and vibration of a stationary bearing during such times as transporting  
• Oscillating motion with a small amplitude  
• Poor lubrication | • Secure the shaft and housing during transporting  
• Transport with the inner and outer rings packed separately  
• Reduce the vibration by preloading  
• Use a proper lubricant |

---

**Photo 7-12-1**  
**Part:** Inner ring of a deep groove ball bearing  
**Symptom:** False brinelling occurs on the raceway  
**Cause:** Vibration from an external source while stationary

**Photo 7-12-2**  
**Part:** Outer ring of Photo 7-12-1  
**Symptom:** False brinelling occurs on the raceway  
**Cause:** Vibration from an external source while stationary

**Photo 7-12-3**  
**Part:** Outer ring of a thrust ball bearing  
**Symptom:** False brinelling of raceway surface at ball pitch  
**Cause:** Repeated vibration with a small oscillating angle

**Photo 7-12-4**  
**Part:** Rollers of a cylindrical roller bearing  
**Symptom:** False brinelling occurs on rolling surface  
**Cause:** Vibration from an external source while stationary
### 7.13 Creep

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creep is the phenomenon in bearings where relative slipping occurs at the fitting surfaces and thereby creates a clearance at the fitting surface. Creep causes a shiny appearance, occasionally with scoring or wear.</td>
<td>• Insufficient interference or loose fit • Insufficient sleeve tightening</td>
<td>• Check the interference, and prevent rotation • Correct the sleeve tightening • Study the shaft and housing precision • Preload in the axial direction • Tighten the raceway ring side face • Apply adhesive to the fitting surface • Apply a film of lubricant to the fitting surface</td>
</tr>
</tbody>
</table>

**Photo 7-13-1**
- **Part:** Inner ring of a spherical roller bearing
- **Symptom:** Creep accompanied by scoring of bore surface
- **Cause:** Insufficient interference

**Photo 7-13-2**
- **Part:** Outer ring of a spherical roller bearing
- **Symptom:** Creep occurs over entire circumference of outside surface
- **Cause:** Loose fit between outer ring and housing
### 7.14 Seizure

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| When sudden overheating occurs during rotation, the bearing becomes discolored. Next, raceway rings, rolling elements, and cage will soften, melt and deform as damage accumulates. | • Poor lubrication  
• Excessive load (Excessive preload)  
• Excessive rotational speed  
• Excessively small internal clearance  
• Entry of water and debris  
• Poor precision of shaft and housing, excessive shaft bending | • Study the lubricant and lubrication method  
• Reinvestigate the suitability of the bearing type selected  
• Study the preload, bearing clearance, and fitting  
• Improve the sealing mechanism  
• Check the precision of the shaft and housing  
• Improve the mounting method |

#### Photo 7-14-1
- **Part:** Inner ring of a spherical roller bearing  
- **Symptom:** Raceway is discolored and melted. Worn particles from the cage were rolled and attached to the raceway  
- **Cause:** Insufficient lubrication

#### Photo 7-14-2
- **Part:** Convex rollers of Photo 7-14-1  
- **Symptom:** Discoloration and melting of roller rolling surface, adhesion of worn particles from cage  
- **Cause:** Insufficient lubrication

#### Photo 7-14-3
- **Part:** Inner ring of an angular contact ball bearing  
- **Symptom:** Raceway discoloration, melting occurs at ball pitch intervals  
- **Cause:** Excessive preload

#### Photo 7-14-4
- **Part:** Outer ring in Photo 7-14-3  
- **Symptom:** Raceway discoloration, melting occurs at ball pitch intervals  
- **Cause:** Excessive preload

#### Photo 7-14-5
- **Part:** Balls and cage of Photo 7-14-3  
- **Symptom:** Cage is damaged by melting, balls become discolored and melted  
- **Cause:** Excessive preload
### 7.15 Electrical Corrosion

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| When electric current passes through a bearing, arcing and burning occur through the thin oil film at points of contact between the race and rolling elements. The points of contact are melted locally to form “fluting” or groove-like corrugations which are seen by the naked eye. The magnification of these grooves will reveal crater-like depressions which indicate melting by arcing. | • Electrical potential difference between inner and outer rings | • Design electric circuits which prevent current flow through the bearings  
• Insulation of the bearing |

---

**Photo 7-15-1**

Part: Inner ring of a tapered roller bearing  
Symptom: Striped pattern of corrosion occurs on the raceway surface

### 7.16 Rust and Corrosion

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| Bearing rust and corrosion are pits on the surface of rings and rolling elements and may occur at the rolling element pitch on the rings or over the entire bearing surfaces. | • Entry of corrosive gas or water  
• Improper lubricant  
• Formation of water droplets due to condensation of moisture  
• High temperature and high humidity while stationary  
• Poor rust preventative treatment during transporting  
• Improper storage conditions  
• Improper handling | • Improve the sealing mechanism  
• Study the lubrication method  
• Anti-rust treatment for periods of non-running  
• Improve the storage methods  
• Improve the handling method |

---

**Photo 7-16-1**  
**Part:** Outer ring of a cylindrical roller bearing  
**Symptom:** Rust on the rib face and raceway surface  
**Cause:** Poor lubrication due to water entry

**Photo 7-16-2**  
**Part:** Outer ring of a slewing ring  
**Symptom:** Rust on raceway surface at ball pitch  
**Cause:** Moisture condensation during stationary periods

**Photo 7-16-3**  
**Part:** Inner ring of a spherical roller bearing  
**Symptom:** Rust on raceway surface at roller pitch  
**Cause:** Entry of water into lubricant

**Photo 7-16-4**  
**Part:** Rollers of a spherical roller bearing  
**Symptom:** Pit-shaped rust on rolling contact surface. Corroded portions  
**Cause:** Moisture condensation during storage
## 7.17 Mounting Flaws

<table>
<thead>
<tr>
<th>Damage Condition</th>
<th>Possible Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
</table>
| Straight line scratches on surface of raceways or rolling elements caused during mounting or dismounting of bearing. | • Inclination of inner and outer rings during mounting or dismounting  
• Shock load during mounting or dismounting | • Use appropriate jig and tool  
• Avoid a shock load by use of a press machine  
• Center the relative mating parts during mounting |

### Photos
